- 1. A surgical retractor comprising:
 - a laterally extending rack having a proximal and distal portion;
- a first arm connected to the rack at a first location and extending longitudinally from the first location, said first arm having a first segment, a middle hinged segment, and a third segment, said middle hinged segment connected to the first and third segments;

a moveable second arm having a housing for slidably engaging a portion of the rack, said second arm extending longitudinally from the housing; said housing having an adjustment mechanism for allowing the positioning of the housing relative to the rack at a desired location and the at least temporary fixation of the housing at the desired location; and

wherein said middle segment of said first arm is angled toward the second arm.

- 2. The surgical retractor of claim 1 wherein said second arm further comprises a first segment, a middle hinged segment, and a third segment, said middle hinged segment connected to the first and third segments.
- 3. The surgical retractor of claim 2 wherein the middle hinged segment of the second arm is angled toward the first arm.

- 4. The surgical retractor of claim 3 wherein a first angle of the middle hinged segment relative to the first segment of the first arm is substantially equal to a second angle of the middle hinged segment relative to the first segment of the second arm.
- 5. The surgical retractor of claim 3 wherein a third angle of the middle hinged segment relative to the third segment of the first arm is substantially equal to a fourth angle of the middle hinged segment relative to the first segment of the second arm.
- 6. The surgical retractor of claim 1 wherein the first segments of the first and second arms are substantially parallel.
- 7. The surgical retractor of claim 1 wherein the third segments of the first and second arms are substantially parallel.
- 8. A surgical retractor comprising:
 - a laterally extending rack having a proximal and distal portion;
- a first arm connected to the rack at a first location and extending longitudinally from the first location to an end;
- a moveable second arm having a housing for slidably engaging a portion of the rack, said second arm extending longitudinally from the housing to an end; said housing having an adjustment mechanism for allowing the positioning of the housing relative to the rack at a desired location and at least temporary fixating the housing at the desired location, said second arm having a first segment, a

middle hinged segment, and a third segment, said middle hinged segment connected to the first and third segments; and

wherein said middle segment of said second arm is angled toward the first arm.

- 9. The surgical retractor of claim 8 wherein the end of the first arm is rotatable about a longitudinal axis relative to the rack.
- 10. The surgical retractor of claim 8 wherein the end of the second arm is rotatable about a longitudinal axis relative to the rack.
- 11. The surgical retractor of claim 8 wherein the first arm is connected to rack at a housing for slidably engaging a portion of the rack, said housing having an adjustment mechanism for allowing the positioning of the housing relative to the rack at a desired location and at least temporarily fixating the housing at the desired location.
- 12. A surgical retractor comprising:
 - a laterally extending rack having a proximal and distal portion;
- a first arm connected to the rack at a first location and extending longitudinally from the first location to an end;
- a moveable second arm having a housing for slidably engaging a portion of the rack, said second arm extending longitudinally from the housing to an end; said housing having an adjustment

mechanism for allowing the positioning of the housing relative to the rack at a desired location and at least temporary fixating the housing at the desired location; and

at least one of the first and second arms rotatable about a longitudinal axis relative to the rack.

- 13. The surgical retractor of claim 12 wherein the at least one of the first and second arms further comprises a locking lever for selectively securing the one of the first and second arms in a fixed rotational position relative to the rack.
- 14. The surgical retractor of claim 12 wherein the second arm further comprises a first, second and third segment with the second segment hinged intermediate the first and third segment, and said second segment is angled toward the first arm.
- 15. The surgical retractor of claim 12 wherein the first arm further comprises a first, second and third segment with the second segment hinged intermediate the first and third segment, and said second segment is angled toward the second arm.
- 16. The surgical retractor of claim 12 wherein the rack is domed intermediate the first location and the desired location.

- 17. The surgical retractor of claim 12 wherein the at least one of the first and second arms is the second arm and the second arm further comprises at least a first segment connected to the housing with said first segment rotatable relative to the housing.
- 18. The surgical retractor of claim 12 wherein the at least one of the first and second arms is the first arm and the first arm further comprises at least a first segment extending longitudinally of the first location and the first segment rotatable relative to the first location.
- 19. The surgical retractor of claim 17 wherein the second arm further comprises a locking mechanism selectively securing the first segment relative to the housing fixing an angle of rotation of the first segment relative to the housing.
- 20. The surgical retractor of claim 18 wherein the first arm further comprises a locking mechanism selectively securing the first segment relative to the first location fixing an angle of rotation of the first segment relative to the housing.
